1. Introduction

In recent years, the integration of Artificial Intelligence (AI) in healthcare has transformed the way diseases are diagnosed and treated. Early detection of diseases plays a critical role in improving patient outcomes, reducing mortality rates, and minimizing healthcare costs. However, traditional diagnostic methods often suffer from delays due to limited resources, human error, and lack of accessibility in remote areas.

MedPredicPro is a web-based AI-powered system designed to predict diseases at an early stage using machine learning. The system allows users to input symptoms through a modern web interface built with **Next.js**, and provides predictions using trained machine learning models developed in **Python**.

The system also includes a **MongoDB database** to store patient records and a **custom dashboard** to visualize past diagnoses, prediction accuracy, and data trends using graphs. This solution assists healthcare professionals in making faster and more informed decisions.

2. Problem Statement

Healthcare systems worldwide face several challenges in early disease detection:

- Limited diagnostic infrastructure
- Shortage of medical professionals
- High cost of medical tests
- Delayed analysis of symptoms

These issues often result in late detection of diseases, leading to severe complications or loss of life.

Problem Definition

To develop a **web-based AI system (MedPredicPro)** that:

- Analyzes patient symptoms
- Predicts diseases efficiently and accurately
- Stores patient history
- Provides insights through a dashboard

3. Objectives

The main objectives of this project are:

- To design and implement a machine learning model for disease prediction
- To preprocess medical datasets for improved accuracy
- To build an interactive frontend using Next.js
- To integrate MongoDB for storing patient data
- To develop a dashboard for visualization and analysis
- To evaluate model performance using standard metrics

4. Literature Review

Several studies have shown the effectiveness of AI in disease detection.
Machine learning models such as:

- Logistic Regression
- Decision Trees
- Random Forest
- Support Vector Machines

have been widely used to predict diseases like diabetes, heart disease, and cancer.

Key Observations

- AI models achieve high accuracy with quality datasets
- Early prediction reduces treatment costs
- Web integration improves accessibility
- Data preprocessing is crucial

Research Gaps

- Lack of real-time dashboards
- Poor user interfaces
- Limited scalability

MedPredicPro addresses these issues by combining modern web technologies with machine learning and visualization tools.

5. Methodology

5.1 Data Collection

Medical datasets are collected from:

- Kaggle
- Open healthcare databases

5.2 Data Preprocessing

The following steps are performed:

- Handling missing values using SimpleImputer
- Encoding categorical variables
- Feature normalization
- Splitting dataset into training and testing sets

5.3 Machine Learning Implementation

The system uses Python with the following libraries:

```
import joblib
import numpy as np
import pandas as pd
from sklearn.base import clone
from sklearn.compose import ColumnTransformer
from sklearn.impute import SimpleImputer
from sklearn.inspection import permutation_importance
from sklearn.metrics import (
    accuracy_score,
    precision_score,
    recall_score,
    f1_score
)
```

5.4 Model Selection

Algorithms used:

- Logistic Regression
- Random Forest (preferred for better accuracy)

5.5 Model Training

- Supervised learning approach
- Model trained on labeled datasets
- Model saved using joblib for reuse

5.6 Model Evaluation

The model is evaluated using:

- Accuracy
- Precision
- Recall
- F1-score

5.7 Deployment

- ML model integrated with backend APIs
- Frontend communicates with backend
- Predictions displayed in real time

6. System Architecture

The system consists of the following layers:

1. Frontend Layer

- Built using Next.js
- User inputs symptoms

2. Backend Layer

- Handles API requests
- Connects frontend with ML model and database

3. Machine Learning Layer

- Processes input data
- Predicts disease

4. Database Layer

- MongoDB stores:
    - Patient details
    - Prediction history

5. Output Layer

- Displays:
    - Predicted disease
    - Accuracy/probability
    - Graphical insights

7. Implementation Details

Technologies Used

Frontend:

- Next.js
- React

Backend:

- Node.js

Database:

- MongoDB

Machine Learning:

- Python
- Scikit-learn
- NumPy, Pandas

Steps Implemented

1. Load dataset
2. Preprocess data
3. Train ML model
4. Evaluate model
5. Save model using joblib
6. Build frontend (Next.js)
7. Create backend APIs
8. Integrate MongoDB
9. Develop dashboard

8. Features of the System

- Disease prediction based on symptoms
- Responsive and user-friendly UI
- Patient history tracking
- Custom dashboard displaying:
    - Accuracy
    - Bar graphs
- Fast real-time predictions
- Easy accessibility

9. Results and Analysis

Performance Metrics

- Accuracy: **85% – 95%**
- Precision: High
- Recall: Good

Observations

- Clean datasets improve accuracy
- Balanced datasets give better predictions
- Random Forest performs efficiently

Dashboard Output

- Displays prediction accuracy
- Shows patient diagnosis history
- Visualizes data using bar charts

10. Advantages

- Early disease detection
- Reduces workload on doctors
- Cost-effective solution

- Scalable system
- Remote accessibility
- Data visualization through dashboard

11. Limitations

- Depends on dataset quality
- Not a replacement for doctors
- Limited to trained diseases
- Requires regular updates

12. Future Scope and Scalability

Future Improvements

- Integration with hospital systems
- Deep learning for image-based diagnosis
- Mobile application development
- Voice-based input system

Scalability

- Can support more diseases
- Cloud-based deployment
- Integration with healthcare platforms

13. Conclusion

MedPredicPro demonstrates how machine learning and modern web technologies can improve healthcare services. By combining **Next.js, MongoDB, and Python-based ML models**, the system provides fast, accurate, and accessible disease prediction.

The addition of a **custom dashboard** enhances usability by offering insights into patient history and model performance. With further improvements, MedPredicPro has the potential to become a powerful tool in early disease detection and healthcare support.
